For the past 20 years, Dr. Riley Elliott has been studying great white sharks in New Zealand. His work has helped to shed light on the complex behavior of these amazing animals and has helped to dispel some of the myths that surround them.

"Great white sharks are not the mindless killing machines that they are often portrayed as," says Elliott. "They are actually very intelligent and social animals."

Elliott's work has helped to show that great white sharks are not as dangerous as people think. In fact, they are more likely to avoid humans

than to attack them.

"The vast majority of great white shark attacks are unprovoked," says Elliott. "And even when they do attack, they are usually not fatal."

Elliott's work is helping to change the way people think about great white sharks. He is helping to show that these animals are not the monsters that they are often made out to be.

"I want people to understand that great white sharks are a vital part of our ecosystem," says Elliott. "They are apex predators that help to keep our oceans healthy."

Elliott's work is also helping to protect great white sharks from extinction. These animals are facing a number of threats, including overfishing, habitat loss, and climate change.

"We need to do everything we can to protect great white sharks," says Elliott. "They are an important part of our planet."

## **Elliott's Work**

Elliott's work focuses on three main areas:

- **Research:** Elliott conducts research on great white sharks to learn more about their behavior, ecology, and population dynamics.
- **Education:** Elliott educates the public about great white sharks to help dispel myths and build support for their conservation.
- **Conservation:** Elliott works to protect great white sharks from extinction by supporting conservation measures and advocating for

their protection.

Elliott's research has helped to shed light on many aspects of great white shark behavior. For example, he has shown that great white sharks are capable of learning and memory, and that they have a complex social structure.

Elliott's education work has helped to reach a wide audience with his message about great white sharks. He has given talks to schools, universities, and community groups, and he has been featured in numerous documentaries and articles.

Elliott's conservation work has helped to protect great white sharks from extinction. He has worked to support the creation of marine protected areas, and he has advocated for the use of sustainable fishing practices.

## **The Future of Great White Sharks**

The future of great white sharks is uncertain. These animals are facing a number of threats, including overfishing, habitat loss, and climate change.

However, Elliott is optimistic about the future of great white sharks. He believes that his work is helping to raise awareness of these animals and build support for their conservation.

"I believe that we can save great white sharks," says Elliott. "It will take a lot of work, but I am confident that we can do it."

## **How You Can Help**

There are a number of things that you can do to help save great white sharks:

- **Learn more about great white sharks.** The more people who understand these animals, the more likely we are to protect them.
- **Support organizations that are working to protect great white sharks.** There are a number of organizations that are working to protect great white sharks, including the Shark Trust and the Marine Conservation Society.
- **Choose sustainable seafood.** Overfishing is one of the biggest threats to great white sharks. By choosing sustainable seafood, you can help to reduce the demand for shark meat.
- **Reduce your carbon footprint.** Climate change is another major threat to great white sharks. By reducing your carbon footprint, you can help to slow the rate of climate change and protect great white sharks.

By taking these actions, you can help to save great white sharks and ensure that these amazing animals continue to thrive in our oceans for generations to come.
